To: MADAR Network <madar-network@googlegroups.com>

TO ALL OPS

As several of the MADAR 101 papers stress, and mentioned in the very first set-up and instruction pages an op receives (welcome aboard letter included) ALWAYS unplug the MADAR from the wall or test strip BEFORE you touch it, move it, align it. Once you have it placed in position or have relocated it, THEN plug it back in. After that do not touch or move it or place it where animals or anyone else can disturb it.

The device must be placed flat. Several ops placed them or hung them vertically and wondered why they didn't work. By flat we mean reasonably level flat.

The reason why this device works is because the magnetometer we use is extremely sensitive. NEVER place on a shelf or table that will get any vibration. Windowsills are a definite no-no. Temperature control is important as well. This is NOT a field unit and must be restricted to indoors with fairly constant reasonable temperature control.

We know when your MADAR is triggered, so do not report any alert UNLESS you observed a UAP or unless you did something you are certain triggered the device. It is important that you send in an alibi if you triggered the alert with a cut and paste version of the alert message.

This is a necessary reminder of what is and should be considered SOP.
